

CTU Training Solutions is a private education and training organisation that provides information technology and business-related education to students across South Africa. As the organisation continues to grow, there is an increasing need for a secure, scalable, and cost-effective IT infrastructure. This document outlines the business requirements for implementing a cloud-based solution using Microsoft Azure to support CTU Training Solutions' operational, academic, and administrative needs.

Type of Organisation

CTU Training Solutions is a **medium-sized organisation** operating within the **education and training industry**. Its primary purpose is to deliver academic programmes, training materials, assessments, and digital learning resources to students while supporting staff with administrative and academic systems. The organisation relies heavily on information technology to support online learning platforms, internal systems, and data management for both staff and students.

Main IT Needs of the Organisation

CTU Training Solutions requires a reliable and flexible IT environment that can support multiple users, applications, and data types. Key IT needs include secure access for staff and students, storage for academic and administrative data, and hosting of applications such as learning management systems and internal tools. The organisation must ensure data availability, system reliability, and backup capabilities while maintaining performance during peak academic periods such as examinations and registrations.

Benefits of a Cloud Solution (Azure) over On-Premises Infrastructure

A cloud-based solution using Microsoft Azure offers several advantages over traditional on-premises infrastructure. Azure allows CTU Training Solutions to scale resources up or down based on demand, reducing unnecessary hardware costs. Cloud infrastructure also lowers upfront capital expenditure, as there is no need to purchase or maintain physical servers. In addition, Azure provides built-in high availability, disaster recovery, and global accessibility, allowing staff and students to securely access systems from different locations.

Security and Compliance Requirements

Security is critical due to the sensitive nature of student and staff information. CTU Training Solutions must ensure confidentiality, integrity, and availability of data. Security requirements include strong user authentication, role-based access control, data encryption, and regular backups. Compliance with applicable data protection regulations, such as South Africa's Protection of Personal Information Act (POPIA), must be considered to ensure personal data is handled responsibly and securely within the Azure environment.

Expected Number of Users

The expected number of users accessing the Azure environment includes administrative staff, academic staff, IT personnel, and students. Initially, the system should support approximately 300–500 users, with

the ability to scale as student enrolments increase. Azure's scalability ensures that the environment can handle growth without requiring major infrastructure changes.
